STATIC SURFACE PRESSURES OF THE  
O.004 SCALE 049 ORBITER  
IN THE LAUNCH CONFIGURATION

By Robert E. Buchholz and Mickey Gamble

A B S T R A C T

This test was conducted to obtain wing and lower body surface static pressure data for the Space Shuttle 049 Orbiter while in the launch configuration. The purpose of the test was to determine the optimum incidence position of the orbiter relative to the hydrogen-oxygen (HO) tank and the optimum radial position of the solid rocket motors (SRM) on the HO tank.

The orbiter was mounted on the HO tank at incidence angles of 0 and -1.5 degrees to determine the optimum incidence position. The SRM boosters were tested at radial positions of 75, 90, and 135 degrees on the HO tank to determine their optimum position with respect to the loads imposed on the orbiter.

The test was conducted in the NASA/MSFC 14 x 14-Inch Trisonic Wind Tunnel over a Mach number range of 0.6 to 4.96. Angle of attack was varied from -8 to +8 degrees at zero degree angle of sideslip, and at sideslip angles varying from -6 to +6 degrees at zero degree angle of attack.

## CONFIGURATIONS INVESTIGATED

Test results reported herein were obtained on a 0.004 scale 049 Orbiter model in the launch configuration (see figures 1 through 5). Each of the model components tested are listed below. Combinations of the components tested are shown in Table III (Data Set Collations). Dimensional data for the components is presented in Table IV.

<u>MODEL COMPONENT SYMBOL</u>	<u>DESCRIPTION</u>
O1	Baseline 049 Orbiter (including the abort solid rocket motors) (B1W4V11A1)
O2	Baseline 049 Orbiter (without the abort solid rocket motors) (B1W4V11)
T1	346-in. diameter H0 tank with 22° nosecone.
T3	346-in. diameter H0 tank with 17° nosecone.
S1	156-in. diameter solid rocket motor with 17° nosecone (baseline).

## TEST FACILITY DESCRIPTION

The Marshall Space Flight Center 14" x 14" Trisonic Wind Tunnel is an intermittent blowdown tunnel which operates by high pressure air flowing from storage to either vacuum or atmospheric conditions. A Mach number range from .2 to 5.85 is covered by utilizing two interchangeable test sections. The transonic section permits testing at Mach 0.20 through 2.50, and the supersonic section permits testing at Mach 2.74 through 5.85. Mach numbers between .2 and .9 are obtained by using a controllable diffuser. The range from .95 to 1.3 is achieved through the use of plenum suction and perforated walls. Mach numbers of 1.44, 1.93 and 2.50 are produced by interchangeable sets of fixed contour nozzle blocks. Above Mach 2.50 a set of fixed contour nozzle blocks are tilted and translated automatically to produce any desired Mach number in .25 increments.

Air is supplied to a 6000 cubic foot storage tank at approximately -40°F dew point and 500 psi. The compressor is a three-stage reciprocating unit driven by a 1500 hp motor.

The tunnel flow is established and controlled with a servo actuated gate valve. The controlled air flows through the valve diffuser into the stilling chamber and heat exchanger where the air temperature can be controlled from ambient to approximately 180°F. The air then passes through the test section which contains the nozzle blocks and test region.

Downstream of the test section is a hydraulically controlled pitch sector that provides a total angle of attack range of 20° (+10°). Sting offsets are available for obtaining various maximum angles of attack up to 90°.

## DATA REDUCTION

All static pressures were reduced to the form of pressure coefficients by referencing them to freestream static pressure and dividing by freestream dynamic pressure:

$$CP = \frac{\text{Local Static Pressure} - \text{Freestream Static Pressure}}{\text{Freestream Dynamic Pressure}}$$

$$CP = (P_l - P_\infty)/q$$

Table 1 lists positions of the individual surface pressure taps. The positions are non-dimensionalized by wing semi-span in the lateral direction and by local chord length in the longitudinal direction.
